

1. A transmitter, for transmitting an intermittent sequence of messages to maintain synchronisation between the transmitter and at least one receiver, comprising:
control means arranged to provide messages for transmission, each of said
5 messages forming part of said sequence of messages and comprising control information for effecting synchronisation, including timing information, wherein said timing information is dependent upon when the transmission of a following message in the sequence occurs; and
transmission means, responsive to said control means, for transmitting each
10 of said messages.
2. A transmitter as claimed in claim 1 wherein said timing information is indicative, to a receiver, of the period of time between the transmission of a message containing that timing information and the transmission of a
15 following message in the sequence.
3. A transmitter as claimed in claim 1 wherein said timing information comprises the value of the period of time between the transmission of a message containing that timing information and the transmission of said
20 following message in the sequence.
4. A transmitter as claimed in claim 1 wherein said timing information comprises the value of the period of time between the transmission of a message containing that timing information and the transmission of the
25 following message in the sequence compared to the period of time between the transmission of the message containing that timing information and the transmission of a preceding message in the sequence.
5. A transmitter as claimed in claim 1 wherein said following message is
30 the next message in the sequence.

6. A transmitter as claimed in claim 5, wherein said preceding message is the directly preceding message.

5 7. A transmitter as claimed in claim 1 wherein said sequence of messages comprises a sequence of groups of messages each of said groups of messages comprising a plurality of messages in series.

8. A transmitter as claimed in claim 7 wherein said following message is a
10 message in a following group.

9. A transmitter as claimed in claim 8 wherein said following group is the next group.

15 10. A transmitter or receiver as claimed in claim 7 wherein said preceding message is a message in a preceding group.

11. A transmitter as claimed in claim 12 wherein said preceding group is the directly preceding group.

20

12. A transmitter as claimed in claim 1 wherein said control information identifies the receiver.

25

13. A transmitter as claimed in claim 1 wherein said control information identifies the messages as broadcasted messages.

14. A transmitter as claimed in claim 1 wherein said control information comprises a sequence for correlation by the receiver.

607260-1530060

54818

15. A transmitter as claimed in claim 8 wherein said control information comprises a value identifying the number of messages in the following group.

5 16. A transmitter as claimed in claim 8, wherein said control information comprises a value identifying the time between messages in the following group.

10 17. A transmitter as claimed in claim 9 wherein said control means in arranged to vary the time between the transmission of a pair of successive groups of messages by an amount such that there is coincidence between the time of transmission of a message in the following group of the pair and the expected time of transmission, in the absence of a variation, of a message in the following group.

15 18. A transmitter as claimed in claim 19 wherein for said pair of successive groups, said series of messages within each of said pair of groups are separated by equal time intervals.

20 19. A transceiver comprising a transmitter as claimed in claim 1.

20. A computer comprising a transmitter as claimed in claim 1.

21. A mobile communications device comprising a transmitter as claimed in claim 1.

25

22. An accessory for a mobile communications device comprising a transmitter as claimed in claim 1.

23. A communication network comprising transceivers as claimed in claim

30 19.

27. A receiver as claimed in claim 26 wherein said following message is a message in a following group.

28. A receiver as claimed in claim 27 wherein said following group is the next group.

29. A receiver as claimed in claim 25 wherein said control information comprises a value identifying the number of messages in the following group

30. A receiver as claimed in claim 25, wherein said control information comprises a value identifying the time between messages in the following group.

31. A receiver as claimed in claim 25 wherein said timing information comprises the value of the period of time between the transmission of a message containing that timing information and the transmission of said following message in the sequence.

32. A receiver as claimed in claim 25 wherein said timing information comprises the value of the period of time between the transmission of a message containing that timing information and the transmission of the following message in the sequence compared to the period of time between the transmission of the message containing that timing information and the transmission of a preceding message in the sequence.

33. A receiver as claimed in claim 32 wherein said preceding message is a message in a preceding group.

34. A receiver as claimed in claim 33 wherein said preceding group is the directly preceding group.

20

25

41. A computer comprising a receiver as claimed in claim 25.

30

43. An accessory for a mobile communications device comprising a receiver as claimed in claim 25.

5 44. A communication network comprising transceivers as claimed in claim 40.

45. A receiver, for synchronising with a sequence of transmitted messages each comprising control information including timing information, comprising:
 10 a controller arranged to control the operation of the receiver in dependence on received ones of the transmitted messages;
 a clock for providing a time reference to the control means; and
 a receiver including synchronisation circuitry, responsive, when enabled, to the control information in a received message to indicate to the controller
 15 means the reception of said message,
 wherein said controller is arranged to disable said receiver for a period of time dependent upon the timing information in said received message and to enable said receiver to receive a following message in the sequence.

20 46. A receiver, for synchronising with a sequence of transmitted messages each comprising control information including timing information, comprising:
 control means arranged to control the operation of the receiver in dependence on received ones of said transmitted messages;
 a clock for providing a time reference to the control means; and
 25 receiver and synchronisation means responsive to the control information in a received message to indicate to the control means the reception of said message,
 wherein said control means is arranged to enable power conservation within the receiver for a period of time dependent upon the timing information in said

5

10

49. A receiver as claimed in claim 48 wherein said following group is the next group.

15

50. A receiver as claimed in claim 46 wherein said control information comprises a value identifying the number of messages in the following group

20

51. A receiver as claimed in claim 46, wherein said control information comprises a value identifying the time between messages in the following group.

25

52. A receiver as claimed in claim 46 wherein said timing information comprises the value of the period of time between the transmission of a message containing that timing information and the transmission of said following message in the sequence.

53. A receiver as claimed in claim 46 wherein said timing information comprises the value of the period of time between the transmission of a message containing that timing information and the transmission of the following message in the sequence compared to the period of time

mission of the message contents
the transmission of a preceding
claimed in claim 53 wherein said
group.

claimed in claim 54 wherein s
up.

claimed in claim 46 wherein s
synchronisation means, to receive
determined duration.

claimed in claim 46 wherein
tion from the receiving and s
received, re-enables said re
d following packet.

claimed in claim 57 where
n of the messages in the follo

claimed in claim 58 where
tent, the interval between e
ssages in the group.

5

55. A receiver as claimed in claim 54 wherein said preceding group is the directly preceding group.

10

15

20

59. A receiver as claimed in claim 58 wherein said control means re-enablement is intermittent, the interval between enablement depending upon the time between messages in the group.

Sub B' \triangleright

60. A receiver as claimed in claim 46 wherein said control means is arranged to compare the expected time of arrival of a message, provided by the timing information in a preceding received message, with the actual time of arrival of the message as indicated to the control means by the reception

and synchronisation means, and to offset said time reference provided by the clock in dependence on said comparison.

5

61. A transceiver comprising a receiver as claimed in claim 46.

62. A computer comprising a receiver as claimed in claim 46.

10

63. A mobile communications device comprising a receiver as claimed in claim 46.

64. An accessory for a mobile communications device comprising a receiver as claimed in claim 46.

15

65. A communication network comprising transceivers as claimed in claim

61.

20

66. A receiver, for synchronising with a sequence of transmitted messages each comprising control information including timing information, comprising:
a controller arranged to control the operation of the receiver in dependence on received ones of said transmitted messages;
a clock for providing a time reference to the control means; and
a receiver including synchronisation circuitry, responsive to the control information in a received message to indicate to the controller the reception of said message,

25

wherein said controller is arranged to enable power conservation within the receiver for a period of time dependent upon the timing information in said received message, said period of time being such that power conservation is disabled to receive a following message in the sequence.
